

Horizontal Silo and Big Bag Filling System

Technical Data	Plant Description
Product - WTE filter particulate derived from a number of different sites around the north of the UK.	The clients requirement was to provide an installation to accept bulk FGT waste product and to bag off for long term underground storage, working within the constraints of the building.
Silo's - 2no. Nominally 90m3.	There are two silos, each of a nominal 50t capacity, feeding a common bagging line. The bagging line is automatic and includes a weighing system, densification table and auto pallet placing. A system of powered and roller accumulating conveyors transfer the bags through into a reception hall and from here the bags are containerised for shipment to the underground storage facility.
